

Do you suspect that you have been exposed to COVID-19?

Are you experiencing acute respiratory illness with a sudden onset of at least one of the following symptoms: cough, sore throat, shortness of breath, fever of 38°C or higher, body aches, chills, loss of smell or loss of taste, nausea, vomiting, diarrhea, fatigue or weakness?

Please note that it may take up to 14 days to develop these signs and symptoms.

Contact your healthcare provider:

- Phone your general practitioner
- Visit your nearest emergency unit and phone them ahead to inform them of your signs and symptoms
- Phone the National Institute for Communicable Diseases (NICD) or the Coronavirus SA hotline 0800 029 999

If you need to get tested, visit the following websites for more information:

- Pathcare
- Ampath
- Lancet
- Vermaak and Partners

Implement self-isolation:

- stay at home
- monitor yourself daily
- do not participate in any public activities

If you need to self-isolate, here are some tips.

•

For more information on frequently asked questions click here.

NO

Have you been in close contact with someone who has been diagnosed with COVID-19; or have you travelled to areas with local transmission; or worked in or visited a facility where COVID-19 positive patients are treated?

NO

IF YOU DEVELOP THE

Acute respiratory illness with a sudden onset of at least one of the following symptoms: cough, sore throat, shortness of breath, fever of 38°C or higher, body aches, chills, loss of smell or loss of taste, nausea, vomiting, diarrhea, fatigue or weakness.

FOLLOWING SYMPTOMS:

YES

Please note that it may take up to 14 days to develop symptoms.

As expected from all citizens, implement the following:

- Observe social distancing and avoid close contact
- Implement frequent and strict hand hygiene and decontamination
- Restrict movement from your home where possible or/and as per the government guidelines
- Cancel or avoid large gatheringsAvoid social facilities

COVID-19 (Coronavirus) General Information

FEVER

SORE THROAT

SHORTNESS OF BREATH Trouble breathing

COUGH

CHILLS

BODY ACHES Fatigue, weakness

GASTRO-INTESTINAL SYMPTOMS

LOSS OF TASTE OR SMELL

Nausea, vomiting, diarrhea

What are the signs and symptoms?

Reported symptoms include:

- Fever 38°C or higher Loss of smell / taste
- Dry cough
- Nausea
- Shortness of breath
- Vomiting
- Sore throat
- Diarrhea
- Body aches
- Fatigue
- Chills
- Weakness

How is COVID-19 diagnosed?

- COVID-19 is diagnosed by a laboratory test, polymerase chain reaction (PCR) molecular test, on a respiratory tract sample.
- Samples are collected from the nose and throat. A blood sample may be taken.
- Please present yourself for testing if you have an acute respiratory illness with a sudden onset of at least one of the following symptoms: cough, sore throat, shortness of breath, fever of 38°C or higher, body aches, chills, loss of smell or taste, nausea, vomiting, diarrhea, fatigue or weakness.

How to reduce the general risk of spreading acute respiratory infections like COVID-19 and other viruses such as seasonal influenza

Cover your cough or sneeze with a flexed elbow or tissues. Throw the tissues in a bin. Do not cover your cough or sneeze with your hands or cough or sneeze in to open air.

Avoid close contact with people who are sick.

Maintain a distance of at least 1 to 2 metres when interacting with other persons.

Avoid touching your eyes, nose and mouth with your hands.

Wash your hands often with soap and warm water for at least 20 seconds. If soap and water are not available, use an alcohol-based hand sanitiser.

Stay home when you are sick and try to keep your distance from others.

Wear a face mask as per current legislation.

Waiting for test results

SELF-ISOLATION AT HOME

While awaiting test results for COVID-19; and you have been assessed as being medically well enough to be managed at home – please consider yourself as potentially infectious until the final results are available.

You will need to abide by the following:

- You should quarantine yourself at home. Don't go to work, avoid leaving your home, and as far as possible avoid close interactions with other people.
- You should clean your hands with soap and water frequently. Alcohol-based sanitisers may also be used, provided they contain at least 70% alcohol.
- Do not have visitors in your home. Only those who live in your home should be allowed to stay. If it is urgent to speak to someone who is not a member of your household, do this over the phone.
- You should wear a face mask when in the same room (or vehicle) as other people.
- At home, you should stay in a specific room and use your own bathroom (if possible). If you live in shared accommodation with a communal kitchen, bathroom(s) and living area, you should stay in your room with the door closed, only coming out when necessary, wearing a face mask if one has been issued to you. Keep your windows open to allow adequate ventilation.
- You should practice good cough and sneeze hygiene by coughing or sneezing into a tissue, discarding the tissue immediately afterwards in a lined trash can, and then wash your hands immediately. Alternatively you can cough into your flexed elbow.
- If you need to wash the laundry at home before the results are available, then wash all laundry at the highest temperature compatible with the fabric using laundry detergent. This should be above 60°C. If possible, tumble dry and iron using the highest setting compatible with the fabric. Wear disposable gloves and a plastic apron when handling soiled materials if possible and clean all surfaces and the area around the washing machine. Do not take laundry to a laundrette. Wash your hands thoroughly with soap and water after handling dirty laundry (remove gloves first if used).
- You should avoid sharing household items like dishes, cups, eating utensils and towels. After using any of these, the items should be thoroughly washed with soap and water.
- All high-touch surfaces like table tops, counters, toilets, phones, computers, etc. that you may have touched should be appropriately and frequently cleaned.
- Monitor your symptoms seek prompt medical attention if your illness is worsening, for example, if you have difficulty breathing, or if the symptoms of the person you are caring for are worsening. If it's not a medical emergency, call your doctor or healthcare facility. If it is an emergency and you need to call an ambulance, inform the call handler or operator that you are being tested for SARS-CoV-2 (Covid-19).

While awaiting the results, if your symptoms worsen:

Phone your healthcare provider to inform them of your changed symptoms and that you are still awaiting test results.

In case of severe fever or respiratory distress – please go to your nearest emergency unit or phone an emergency medical service. For assistance from Life Emergency Medical Services – call **0860 123 367**. If you are going directly to the unit – call ahead to let them know that you are coming to the unit and that you are awaiting your test results for COVID-19. Take the necessary precautions such as covering your cough.

COVID-19 (Coronavirus)

FREQUENTLY ASKED QUESTIONS

Q What is coronavirus (COVID-19)?

A Coronaviruses are a large family of viruses which may cause illness in animals or humans. In humans, several coronaviruses are known to cause respiratory infections ranging from the common cold to more severe diseases such as Middle East Respiratory Syndrome (MERS) and Severe Acute Respiratory Syndrome (SARS). The most recently discovered coronavirus causes coronavirus disease COVID-19.

Does the coronavirus spread from person to person?

The virus can spread from one person to another, mainly through droplets of saliva or mucus carried through the air for up to 1 metre or so when an infected person coughs or sneezes. Viral particles may be breathed in, land on surfaces that people touch, or be transferred when shaking hands or sharing a drink with someone who has the virus.

Q What is the incubation period for the coronavirus?

An incubation period is the time between being infected by a virus and showing symptoms of the illness. Current information suggests that symptoms of COVID-19 usually appear on average after five days from infection. However, the incubation period may be as short as two days or as long as 14 days before the infected person shows symptoms.

Q What are the symptoms of the new coronavirus?

General symptoms:

Fever

Dry cough

Sore throat

Bodv aches

Chills

■ Shortness of breath ■ Loss of taste or loss of smell ■ Fatigue

Nausea

Vomiting

Diarrhea

Weakness

Those who have the virus may have no obvious symptoms (be asymptomatic) or symptoms ranging from mild to severe. In some cases, the virus can cause pneumonia and be potentially life-threatening.

PLEASE NOTE: Most people who get sick will recover from COVID-19 – 80% of positive patients will have mild symptoms which are flu-like and will not require hospitalisation. Recovery time varies and, for people who are not severely ill, may be similar to a general flu-like episode. People with mild symptoms may recover within a few days. People who have pneumonia may take longer to recover (days to weeks). In cases of severe, life-threatening illness, it may take months for a person to recover. People who are already severely ill and contract the virus have the highest risk of being fatally affected.

COVID-19 (Coronavirus)

Q How is this new coronavirus confirmed?

A specialised test must be done to confirm that a person has COVID-19. However, it is important to note that only persons who show symptoms or meet criteria as set out by the NICD will be tested. If you or a loved one have suspected symptoms, please contact your general practitioner first, who will liaise with the necessary authorities to assist with tests. In cases of severe respiratory distress, please go to your emergency unit. However, inform them of your arrival prior to entering the unit.

Q Can people who are asymptomatic spread coronavirus?

A person who is asymptomatic may be spreading the virus and could make others ill. How often this lasts if asymptomatic transmission is occurring is unclear. The risk of catching the virus from someone with no symptoms, is very low.

Q Can the coronavirus live on surfaces such as fabrics and carpets or hard surfaces?

A How long the new coronavirus can live on a soft surface — and more importantly, how easy or hard it is to spread this way — isn't clear yet. Available evidence suggests it can be transmitted less easily from soft surfaces than frequently-touched hard surfaces, such as a doorknob or the elevator button.

According to WHO, coronaviruses may survive on surfaces for just a few hours or several days. However, many factors will influence this period, including the surface material and weather.

This is the reason why taking personal hygiene steps such as frequently washing your hands with soap and water or an alcohol-based hand sanitiser, and wiping down often-touched surfaces with disinfectants or a household cleaning spray, are excellent infection prevention practices.

Should my children and I wear a face mask to protect against coronavirus?

A Please follow public health recommendations. Currently, the use of face masks are recommended for the general public. You will be required to wear a face mask at all times when entering any Life Healthcare facility as per current legislation.

If you have respiratory symptoms like coughing or sneezing, experts recommend wearing a mask to protect others. This may help contain droplets containing any type of virus, including the flu, and protect close contacts (anyone within 1 to 2 meters of the infected person).

Q Should someone who is immunocompromised wear a mask?

A It is recommended that you wear a face mask if you are immunocompromised as a result of an illness or treatment that you are undergoing, as per current legislation. If your healthcare practitioner advises you to wear a face mask because you have a particularly vulnerable immune system or for other reasons, follow that advice.

COVID-19 (Coronavirus)

Q Is there a vaccine available for coronavirus?

A No vaccine is available, although scientists are working on vaccines. In 2003, scientists tried to develop a vaccine to prevent the SARS virus but the epidemic ended before the vaccine could enter clinical trials.

Q What is the treatment for coronavirus?

A Treatment is based on supportive measures, which means giving fluids, medicine to reduce fever, and, in severe cases, supplemental oxygen. People who become critically ill from COVID-19 may need a ventilator to help them breathe.

Q What should I do if I think I or a loved one has contracted the coronavirus?

A If you have a general practitioner, call them first for advice. It is far more likely to be the seasonal flu or another viral illness.

If you do not have a doctor and you are concerned that you or your child may have coronavirus, contact your local hospital for assistance or advice.

Only people with symptoms of severe respiratory illness should go to their nearest emergency unit. Severe symptoms are rapid heart rate, low blood pressure, high or very low temperatures, confusion, trouble breathing and severe dehydration. However, inform them of your arrival prior to entering the unit.

Q Can people who recover from the coronavirus still be carriers and therefore spread it?

A People who get COVID-19 need to work with providers and public health authorities to determine when they are no longer contagious.

HOW CAN I REDUCE MY CHANCES OF BEING INFECTED OR SPREADING COVID-19?

Implement these simple precautions outlined by the World Health Organization:

 Regularly and thoroughly clean your hands with an alcohol-based hand rub or wash them with soap and water.

Why? Washing your hands with soap and water or using alcohol-based hand rub kills viruses that may be on your hands.

 Maintain at least 1 metre (3 feet) distance between yourself and anyone who is coughing or sneezing.

Why? When someone coughs or sneezes they spray small droplets from their nose or mouth which may contain the virus. If you are too close, you can breathe in the droplets, including the COVID-19 virus if the person coughing has the disease.

Avoid touching your eyes, nose and mouth.

Why? Hands touch many surfaces and can pick up viruses. Once contaminated, hands can transfer the virus to your eyes, nose or mouth. From there, the virus can enter your body and make you sick.

Make sure you, and the people around you, follow good respiratory hygiene. This means covering your mouth and nose with your bent elbow or tissue when you cough or sneeze. Then dispose of the used tissue immediately and wash your hands.

Why? Droplets spread viruses. By following good respiratory hygiene you protect the people around you from viruses such as cold, flu and COVID-19.

Stay home if you feel unwell. If you have a fever, cough and difficulty breathing, seek medical attention and call the healthcare authorities in advance. Follow the directions of your local health authority.

Why? National and local authorities will have the most up to date information on the situation in your area. Calling in advance will allow your health care provider to quickly direct you to the right health facility. This will also protect you and help prevent spread of viruses and other infections.

Stay informed on the latest developments about COVID-19. Follow the advice given by your healthcare provider or your national and local public health authority on how to protect yourself and others from COVID-19.

Why? National and local authorities will have the most up-to-date information on whether or not COVID-19 is spreading in your area. They are best-placed to advise you on what people in your area should be doing to protect themselves.

Keep up to date on the latest COVID-19 hotspots (cities or local areas where COVID-19 is spreading widely). If possible, avoid travelling to places – especially if you are an older person or have diabetes, heart or lung disease.

Why? You have a higher chance of catching COVID-19 in one of these areas.

For any further queries and questions with regard to COVID-19 – please contact the National Institute of Communicable Diseases' (NICD) 24-hour consumer toll-free hotline number: 0800 029 999 or visit the NICD website: http://www.nicd.ac.za/diseases-a-z-index/covid-19/
